ASCII to EBCDIC Conversion Chart

ASCII is a 7-bit coding scheme. Valid hex values for an ASCII character are 00 through 7F. The 8 rows in the chart below correspond to the first hex digit of an ASCII character (0 to 7). The 16 columns correspond to the second hex digit of the character (0 to F). The contents of the cells shows the EBCDIC value (in hex) that corresponds to the ASCII character. For example, to convert the ASCII character 41 (which is the letter "A" in ASCII), look in the row labelled 4, and in the column labelled 1. There you will find that the corresponding EBCDIC character is C1 (which is the letter "A" in EBCDIC).

Characters5935 others are playingASCII and binary characters (the characters)On the Binary to Text page, you saw the  
conversion of text to binary and back again.. Here I'll show you the basic characters behind the code The premise behind the  
conversion process is to take the inputted text and convert it to it's ASCII equivalent and then into it's Binary equivalent.. Of  
course we just do the reverse when going from Binary to Text Here is the listing of ASCII characters and the Binary  
equivalent:All of the code and examples presented in my playground are either modifications of open source code or original  
works of Kindler Chase DBA Roubaix Interactive or a combination of both and are Copyright protected unless noted otherwise.
